Professional Summary

I'm a software engineer with a strong foundation in XR development and a genuine love for solving complex problems. Over the last few years, I've moved from building Unity-based AR/VR apps to designing scalable C++ systems, working with WebRTC streaming, OpenXR, and cross-platform architectures. I enjoy creating technology that feels smooth, reliable, and actually helpful for the people who use it.

Education

TED University

BE in Computer Engineering

Minor in Business Administration

Ankara, TR

Sept 2017 – May 2021

- GPA: 3.48/4.0
- **Graduation Project:** WebRTC streaming with AR/VR application
- **Relevant Coursework:** Computer Architecture, Computer Vision, Machine Learning, Simulation

Experience

Software Engineer

Hololight

Munich, DE

June 2022 – Present

- For Hub, I designed and implemented all AR/VR client applications, integrating our C++ streaming library, the Hub communication layer, and the client-side SQL database. I also maintain these applications across platforms.
- I worked on both the native **streaming library** (C++) and the client applications that use it.
- I am integrating the Android clients into our **CI pipeline** and unifying their codebase to reduce maintenance time and keep development consistent across variants.
- I reworked our **HoloLens 2** UWP client by restructuring the application so new features and maintenance became much simpler.
- I designed, built, and continue to maintain our **Windows desktop client**, from the initial architecture to ongoing updates.
- I implemented the full **Web** client from scratch and integrated it with our application logic so the streaming client works smoothly in the browser.
- I maintain our client applications' user interface which is done in **Unity** and make sure our streaming logic is well integrated into it.
- I contributed new features to our **streaming library** and integrated them into the application logic across supported platforms.

Unity Developer

Simovate

Ankara, TR

Sept 2021 – March 2022

- Developed AR/VR applications for industrial training and remote support using **Unity** and **C#**, with performance-critical components written in **C++**.
- Built a realistic **CNC Milling Machine Simulator** in **C++**, showcased at Oracle's Industry Innovation Lab.
- Created a custom real-time mesh manipulation library for dynamic VR simulations.
- Built modular AR/VR training applications that improved safety and onboarding for manufacturing clients.

- Developed an Android-based **Remote Maintenance Application** enabling experts to provide real-time guidance using live annotations and data streaming.

Android Developer

Medication Hour

Ankara, TR

May 2020 – Sep 2020

- Developed and launched **Medication Hour**, an Android app that helps users manage medication schedules with customizable reminders.
- Built the app using **Java** and **Firebase** for realtime synchronization, authentication, and push notifications.
- Contributed to concept design, UI/UX, and implementation to ensure accessibility across Android devices.
- Managed the full development cycle from idea to deployment and maintenance.

Software Engineering Intern

HAVELSAN

Ankara, TR

Jul 2020 – Aug 2020

- Contributed to the **payroll module** of HAVELSAN's enterprise ERP system.
- Developed backend features using **Java** and **Spring Boot** for the **HAVELSAN KOVAN** system.
- Implemented calculation modules, query logic, and API communication to improve payroll automation.

Game Development Intern

Erik Games

Ankara, TR

June 2019 – July 2019

- Worked on **PlayStation 4** games using **Unreal Engine 4** and **Unity**, developing gameplay features and improving performance.
- Contributed to published titles: [EG Brain Retro Synthesis](#), [Alpha Invasion](#), [EG Brain Breaker](#).

Skills

Languages: C++, C#, SQL, Python, JavaScript

Tools & Technologies: Unity, Git, Unreal Engine, WebRTC, OpenXR, WebSockets, CMake, Firebase, Spring Boot

Specializations: AR/VR/MR Development, Computer Vision, Performance Optimization, Cross-Platform Development

Projects

Last Fighter

[GitHub](#)

- A space shooter game where you defend your base against enemy waves while piloting a spacecraft.
- Built with **Unity** and **C#**, includes custom AI, particle effects, and difficulty that ramps up as you play.

Certifications

Machine Learning with Python: From Linear Models to Deep Learning

Dec 2020

Massachusetts Institute of Technology (MIT)

- Covered Linear Classifiers, Nonlinear Classification, Linear Regression, Collaborative Filtering, Neural Networks, Unsupervised Learning, and Reinforcement Learning.
- Certificate: edx.org/certificates/6313272a840b4d5eb0181c812841be16
