Professional Summary

Software engineer with 4+ years shipping cross-platform XR clients and real-time streaming systems. Most of my work lives in C++ and Unity — WebRTC streaming, OpenXR, native client architecture — across HoloLens 2, Meta Quest, PICO, HTC Vive Focus 3, Magic Leap 2, Windows, Web, and Android. Outside of work I gravitate toward game development, graphics programming, and software architecture.

Education

TED University

BE in Computer Engineering

Minor in Business Administration

Ankara, TR

Sep 2017 – May 2021

- GPA: 3.48/4.0
- **Graduation Project:** WebRTC streaming with AR/VR application
- **Relevant Coursework:** Computer Architecture, Computer Vision, Machine Learning, Simulation

Experience

Software Engineer

Hololight

Munich, DE

Jun 2022 – Present

- Led development of a unified **Unity/C#** front-end architecture powering Hololight's enterprise XR streaming clients across **8+ devices** (Meta Quest, PICO, HTC Vive Focus 3, HoloLens 2, Magic Leap 2, Desktop, Web).
- Designed modular connection management, codec configuration (H.264/H.265), passthrough systems, and cross-device UX — serving as the primary interface layer for all streaming clients.
- Lead developer on the **Hub Client**, a cross-device XR app launcher — app catalog, SSE handling, database management, and multi-vendor release pipelines.
- Developed native **Android C++/JNI** integrations for standalone XR headsets, contributing to runtime performance, reprojection behavior, and device-specific optimizations.
- Architected cross-platform abstraction layers to reduce Android device fragmentation and streamline multi-device feature rollout.
- Built the **Web client** from scratch with JavaScript and WebSockets — XR streaming in the browser, no install required.
- Unified Android build variants into **CI pipelines**, reducing duplication and improving release reliability.
- Built internal **Python** tooling for PR automation, Android build workflows, and git-based validation tools.

Unity Developer

Simovate

Ankara, TR

Sep 2021 – Mar 2022

- Built AR/VR applications for industrial training and remote support in **Unity (C#)**, with performance-critical parts in **C++**.
- Built a realistic **CNC Milling Machine Simulator** in C++ — showcased at Oracle's Industry Innovation Lab.
- Wrote a custom real-time **mesh manipulation library** for VR cutting and deformation simulations.
- Built an Android **Remote Maintenance Application** with live annotations and data streaming so experts

could guide technicians in real time.

Android Developer

Medication Hour

Ankara, TR

May 2020 – Sep 2020

- Built and launched **Medication Hour**, an Android app for managing medication schedules with customizable reminders.
- **Java** and **Firestore** backend handling real-time sync, auth, and push notifications.
- Ran the project end-to-end — concept, UI, development, deployment, and post-launch maintenance.

Software Engineering Intern

HAVELSAN

Ankara, TR

Jul 2020 – Aug 2020

- Worked on the **payroll module** of HAVELSAN's enterprise ERP system (**KOVAN**).
- Built calculation modules, query logic, and API endpoints in **Java/Spring Boot** to automate payroll processing.

Game Development Intern

Erik Games

Ankara, TR

Jun 2019 – Jul 2019

- Shipped **PlayStation 4** games using **Unreal Engine 4** and **Unity** — gameplay features and performance work.
- Contributed to published titles: [EG Brain Retro Synthesis](#), [Alpha Invasion](#), [EG Brain Breaker](#).

Skills

Languages: C++, C#, Python, Java, SQL

Frameworks & Libraries: Unity, OpenXR, WebRTC, OpenGL, MRTK3, XR Interaction Toolkit, Unreal Engine

Tools: Git, CMake, CI/CD, WebSockets, JNI, ImGui

Platforms: Meta Quest, PICO, HTC Vive Focus 3, HoloLens 2, Magic Leap 2, Windows, Android, Web

Specializations: Cross-Platform Architecture, AR/VR/MR Development, Real-Time Rendering, Performance Optimization

Projects

Procedural Planets – GPU-Accelerated Planet Renderer

[GitHub](#)

- Procedural planet renderer in **C++17/OpenGL 4.3+** — compute shaders generate terrain in real time with icosahedron-based LOD.
- Atmospheric scattering, ocean rendering, biome classification, multi-layer noise (Simplex + Fractal).

Certifications

Machine Learning with Python: From Linear Models to Deep Learning

Dec 2020

Massachusetts Institute of Technology (MIT)

- Covered Linear Classifiers, Nonlinear Classification, Linear Regression, Collaborative Filtering, Neural Networks, Unsupervised Learning, and Reinforcement Learning.
- Certificate: edx.org/certificates/6313272a840b4d5eb0181c812841be16
